Anaesthesia - Wrong Data in Patient Record

Digital Health Quick Reference Guide

This Quick Reference Guide will explain how to:

Correct any data that has been incorrectly charted from Patient A into Patient B's record

Definitions:

SAA – Surginet Anesthesia Application

Case - the episode of care that has been selected at the case select screen in SAA

Device - the anaesthesia machine and data monitors

Record - the episode of care in PowerChart

Causes of the problem

This problem may occur when:

- Scenario 1: An **incorrect case** is selected (i.e. incorrect patient or procedure) and all data (monitoring, anaesthetic interventions and drugs) are being documented into the wrong case.
- Scenario 2: An **incorrect device** has been associated to the record and only monitoring data is being documented to the correct case record (interventions and drugs are correct). This can only occur in the following circumstances:
 - o in places where auto-association of computer to anaesthesia machine does not occur (such as in MRI),
 - \circ $\;$ when someone has tried to manually override the auto-association.

This QRG will address both scenarios.

Scenario 1: Incorrect case

The data for Case B can be turned into a Blank record (disassociated from any patient), then reassociated with Patient A instead.

Western Health 🕔

How to disassociate the record from the incorrect patient

1. Check the banner bar to confirm the record has been opened for the incorrect patient. Select "Suspend Case" on the tool bar.

2. Select "Yes" to stop charting. This will stop device association and further documentation on the record.

3. Take note of the Case # which can be found on the banner bar. This is a unique number assigned to each record created. Click OK to close the case.

6. Select the record you wish to disassociate and confirm this is the correct record by checking the date and time it was created and the case # found in step 3. Once this is confirmed, click "Disassociate".

How to associate the disassociated record to the correct case

1. Select "Task" on the menu bar and click "Select Blank Record"

2. Select the hospital campus of the disassociated record and click "OK"

~

Digital Health

CTING BEST CARE

3. Select the disassociated record, checking the date and time it was created to confirm it is the correct record

5. To associate the case to the correct record, select "Task" in the menu bar and click "Associate Case to Record..."

6. Select the correct patient to associate the record with, ensuring the hospital campus, date of procedure, patient's name, date of birth and URN are correct. When this is confirmed, click "OK".

Digital Health

NECTING BEST CARE

Digital Health

Quick Reference Guide

7. Confirm the patient's name, URN and procedure are correct and select the green tick button to verify the case.

8. Select "OK". The record is now associated to the correct patient.

Digital Health

10. When you recommence documentation, any data between suspending the incorrect record and recommencing the correct record is not documented. Some data may need to be entered manually – please see the QRG on "Editing vital signs in SAA" for further instructions.

Scenario 2: Incorrect device

If the correct case record is opened but the monitoring data entered is incorrect (i.e. incorrect device association), the monitoring data will need to be manually deleted and correct monitoring data will need to be manually backfilled. The correct device will also need to be associated to record monitoring from this point.

This can only occur in the following circumstances:

- in places where auto-association of computer to anaesthesia machine does not occur (such as in MRI),
- when someone has tried to manually override the auto-association.

Digital Health

NECTING BEST CARE

Delete existing data

1. Delete vitals by selecting "Document" from the menu bar then click "Value..."

2. Select all the values by selecting then dragging a box around all of them. Press "Delete" on the keyboard
